Population aging and the associated burden of chronic diseases are one of the main challenges in public health worldwide. This Research Topic on "Active Aging and Disease Management" provides a comprehensive

Read Book Active Aging Benefits Of An Active Lifestyle On Health

overview of population aging through fourteen comprehensive papers. Chapter 1 discusses an overview of health systems in active and healthy aging, while Chapter 2 focuses on the role of lifestyles, exercise and new technologies. Chapter 3 debates psychological and cognitive issues in aging and finally in Chapter 4, an older people self assessment is proposed and the role of communities and supporters are highlighted. We think that real social and health care integration at community level could be the key point to deliver effective health promotion and preventive intervention. Enjoy the reading!

The president of New York's Mount Sinai Hospital and a professor of public health present the findings of a MacArthur Foundation study showing that healthy aging is dependent on diet, exercise, and self-esteem rather than genes

The WHO World report on ageing and health is not for the book shelf it is a living breathing testament to all older people who have fought for their voice to be heard at all levels of government across disciplines and sectors. - Mr Bjarne Hastrup President International Federation on Ageing and CEO DaneAge This report outlines a framework for action to foster Healthy Ageing built around the new concept of functional ability. This will require a transformation of health systems away from disease based curative models and towards the provision of older-person-centred and integrated care. It will require the development sometimes from nothing of comprehensive systems of long term care. It will require a coordinated response from many other sectors and multiple levels of government. And it will need to draw on better ways of measuring and monitoring the health and functioning of older populations. These actions are likely to be a sound investment in society's future. A future that gives older people the freedom to live lives that previous generations might never have imagined. The World report on ageing and health responds to these challenges by recommending equally profound changes in the way health policies for ageing populations are formulated and services are provided. As the foundation for its recommendations the report looks at what the latest evidence has to say about the ageing process noting that many common perceptions and assumptions about older people are based on outdated stereotypes. The report's recommendations are anchored in the evidence comprehensive and forward-looking yet eminently practical. Throughout examples of experiences from different countries are used to illustrate how specific problems can be addressed through innovation solutions. Topics explored range from strategies to deliver comprehensive and person-centred services to older populations to policies that enable older people to live in comfort and safety to ways to correct the problems and injustices inherent in current systems for long-term care.

Societies across Europe and Central Asia are aging, but people are not necessarily living longer. This

Read Book Active Aging Benefits Of An Active Lifestyle On Health

demographic trend-caused by a decrease in fertility rather than improved longevity-presents both challenges and opportunities for governments, the private sector, and individuals alike. Some of the challenges are well known. Output per capita becomes smaller if it is shared with an increasingly larger group of dependent older people. At a certain point, there may not be sufficient resources to maintain the living standards of this older group, especially if rising expenditures on health care, long-term care, and pensions must be financed through the contributions and taxes paid by ever-smaller younger age groups. Working adults also contribute the most to the pool of savings. As the size of this group shrinks, savings will decline. But these challenges can be transformed into opportunities. Consider these examples: As longevity increases, workers tend to stay in the workforce longer, and, with the right incentives, they will increase their savings. Many current workers, and perhaps even more in the future, will thus not necessarily become dependent once they turn 65. And with slower population growth and smaller young age groups, societies will have an opportunity to improve the quality of education and maintain productivity. Firms in some countries are already adapting by capitalizing on skills that appreciate with age. Cardiovascular diseases account for more than half the difference in life expectancy (above age 50) between the region and Western Europe for men and 75 percent of the corresponding difference for women. Healthier behavior and health systems focused on preventive care could, with no cost increase, dramatically reduce this risk. These opportunities are not to be missed. As populations age, public discourse ranges from concerns about economic decline and fiscal sustainability of pensions and health systems to optimism about opportunities for healthier and more productive aging. The main contribution of *Golden Aging* is perhaps to show that demography and its consequences are not fixed. Much will depend on how people, firms, and societies adapt and how policy makers and institutions facilitate their behavioral adjustments. The future for Europe and Central Asia does not have to be gray-it can be a golden era of healthy, active, and prosperous aging.

Increased life expectancy and the ageing of the population have been the subject of attention in Western countries, and particularly in Europe, for some years now. The challenge of 'squaring the circle' between ends and means - as well as between personal aspirations and systemic constraints - in health and social care continues to be a major concern for policymakers and all those involved in the delivery of services. This book, *Active Ageing and Healthy Living: A Human Centered Approach in Research and Innovation as Source of Quality of Life*, presents the results of a number of research projects from the Universit Cattolica del Sacro Cuore - the largest private university in Italy and in Europe - with a strong commitment to the areas of medicine and health sciences, economics, business, international relations, political science, psychology and communications. Visions and research directions for the future are also presented and discussed. The introduction to the book addresses the challenges posed by

Read Book Active Aging Benefits Of An Active Lifestyle On Health

an increasingly ageing population and the way in which multidisciplinary research can contribute to positive outcomes. The remainder of the book is divided into two sections. The first proposes promising research directions for future focus, and includes papers on demographic change; frailty in the elderly; the role of diet in healthy ageing; active ageing; and positive technology. The second section deals with recent developments in research into active ageing and healthy living (AA&HL). It addresses numerous topics, including: mechanisms to shift the balance from unhealthy to healthy ageing; nutrition; the role of ICTs for older people; work, retirement and health; and empowering skills for AA&HL.

Healthy aging doesn't occur by accident. This book provides information you can use to successfully manage the aging process and maintain or improve the quality of your living. Inside you'll discover: how to approach the aging process; how to deal with changes in the way your body looks and works; how to exercise safely and effectively; how to maintain a positive outlook on life; how to nurture your mind and spirit; how to manage your finances; how to stay connected with family and friends; how to maintain your independence; how to secure help if you need it.

The challenge of population aging requires innovative approaches to meet the needs of increasing numbers of older people. Emerging information and communication technologies (ICTs), such as pervasive computing and ambient assistive technology, have considerable potential for enhancing the quality of life of many older people by providing additional safety and security while also supporting mobility, independent living, and social participation. The proposed book will be a landmark publication in the area of technology and aging that will serve as a statement of the current state-of-the-art and as a pointer to directions for future research and emerging technologies, products, and services.

In an unprecedented series of studies, Harvard Medical School has followed 824 subjects -- men and women, some rich, some poor -- from their teens to old age. Harvard's George Vaillant now uses these studies -- the most complete ever done anywhere in the world -- and the subjects' individual histories to illustrate the factors involved in reaching a happy, healthy old age. He explains precisely why some people turn out to be more resilient than others, the complicated effects of marriage and divorce, negative personality changes, and how to live a more fulfilling, satisfying and rewarding life in the later years. He shows why a person's background has less to do with their eventual happiness than the specific lifestyle choices they make. And he offers step-by-step advice about how each of us can change our lifestyles and age successfully. Sure to be debated on talk shows and in living rooms, Vaillant's

Read Book Active Aging Benefits Of An Active Lifestyle On Health

definitive and inspiring book is the new classic account of how we live and how we can live better. It will receive massive media attention, and with good reason: we have never seen anything like it, and what it has to tell us will make all the difference in the world.

This book presents an analysis of active ageing and physical activity from a multidisciplinary perspective. With descriptions of exercises, adequately illustrated with pictures, this book shows that regular physical activity reduces the prevalence of chronic diseases associated with ageing, as well as the risk of morbidity and mortality of the elderly. It confirms that exercise programs minimize the psychomotor decline, prevent the loss of functionality, inability and dementia, and foster significant gains in health and well-being, leading to increased quality of life of the elderly.
