Uses, Problems in Construction of Index Number
An index number in statistics is a tool that we generally use to measure the difference in relative changes from time to time. The difference can also be

Access Free The Index Number Problem

from place to place. It can be thought of as the arithmetic mean that we use to find or represent some values of a particular data set.

Uses, Problems in
Construction of Index Number
in Statistics

The longstanding question concerning how such an index should be constructed is known as 'The Index Number Problem'. The ordinary consumer price index represents a practical response to this need. However the search for a true price index has given rise to extensive thought and theory to which an

rise to extensive thought and theory to which an impressive number of economists have each contributed. However, there have been hold-ups at a basic level.

Index Number Problem:
Construction Theorems -
Oxford ...

An index number is not applicable to an individual belonging to a group for which it is constructed. If an index number shows a rise in the price level, an individual may not be affected by it. This is because an index number reflects averages.

Selection of base year:
Selection of base year is
another problem in the
construction of the index
number. The index number for
a particular future year is
compared against a year in
the near past, which is
called a base year. It may
be kept in mind that the
base year should be a normal
year and economically stable
year.

average in the construction of index numbers because of following reasons: (i) in the constructions of index number we are concerned with ratios of relative changes and the geometric mean gives equal weights to equal ratio of change; (ii) geometric mean is less susceptible to major variations as a result of violent fluctuations in the values of the individual items; and (iii) index numbers calculated by using the average are reversible and ...

Selection of items :

Access Free The Index Number Problem

Collection of data is the main problem in constructing index number, as there is a large variety of goods and prices. If the number of the commodities is too large, a choice of some representative items has to be made. On the other hand, inclusion of too few items would make the index number unrepresentative of the whole.

Explain the problems in the construction of Index Number

...

The second problem in the construction of index numbers is the selection of the commodities. Since all commodities cannot be

Access Free The Index Number Problem

included, only representative commodities should be selected keeping in view the purpose and type of the index number.

Index Numbers:

Characteristics, Formula,
Examples, Types ...

The selection of the base period is the most important step in the construction of an index number. It is a period against which comparisons are made. The base period should be normal and free from any unusual events such as war, famine, earthquake, drought, boom, etc. It should not be either very recent or remote.

Construction of a price index, or how an amount at one date can be converted into the right amount at another date.

Introduction: The Index
Number Problem - Oxford
Scholarship

The index number problem is the term used by economists to describe the limitation of statistical indexing, when used as a measurement for cost-of-living increases. For example, in the Consumer Price Index, a reference year's "market basket" is assigned an index number of 100.
